# Design questions

- Specific questions that frame the problem for ideation

**Name:**
**Date:**
**Version:**

## Structure

*A design question is based on the "jobs to be done" (see jobs)*

How might we...

## Strategies and examples

*To help you find good design questions, you can use some different strategies to help you see the jobs to be done from different angles. See strategies and examples here.*

### Job to be done

Louise and Jens, parents of three children, rush through the airport and then have to wait for several hours at their gate. They need to entertain their lively children because "hysterical, lively, screaming kids" annoy the other, already frustrated, passengers.

### Strategies and examples of design questions

**Reinforce the good:**
*How might we use the children's energy to entertain the other passengers?*

**Removing the bad:**
*How might we separate the children from the other passengers?*

**Investigate the opposite:**
*How might we make the waiting time a fun part of the trip?*

**Question the assumption:**
*How might we completely eliminate the waiting time at the airport?*

**Focus on adjectives:**
*How might we make hurrying, fun?*

**Use analogies:**
*How might we make the airport more like a spa? Or a playground?*

**Oppose the challenge:**
*How might we make the airport a place children want to go to?*

# Prototyping examples

Name:
Date:
Version:

| Name | Description | Level of difficulty | | | Especially suitable for |
|---|---|---|---|---|---|
| **Sketches** | Sketch the idea on paper, digital, post-its, etc. and present it for feedback. | ● | | | Almost everything |
| **Wireframes** | Early conceptual design of websites where features and structure can be tested. | | ● | ● | Websites |
| **Storyboard** | Displays an experience from the user's perspective in a series of images from which feedback is obtained | ● | ● | | Experiences |
| **Video** | Recording a video showing an experience for which the user can provide feedback | | ● | ● | Experiences |
| **Physical model** | Displays an idea in 3D, built from materials such as LEGO, PU foam and cardboard where spatiality can be tested | ● | ● | | Products and the physical space |
| **Role play** | The team performs role-playing that enables testing of the user's emotional response. | ● | | | Experiences, products and services |
| **Fake door** | Deliberate false access to a product or service that does not exist to measure interest | | ● | ● | Products and services |
| **Mockup** | Used to test the overall impression of a new system, but without functionality | | ● | | Physical and digital products |
| **Relabel** | A product or service from another provider with a false “label” for testing new types of services | ● | | | Products and services |

# NABC - Pitch

**Name:**

**Date:**

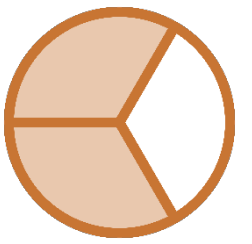
**Version:**

An NABC pitch describes 4 main elements: 1) the central need you have found with the user, 2) your approach to meeting the need, 3) the specific values you create, and 4) how your approach differs favorably from the competing alternatives.

## User need

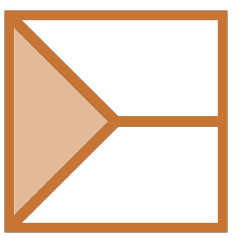
With… [user group]

We have observed… [needs]



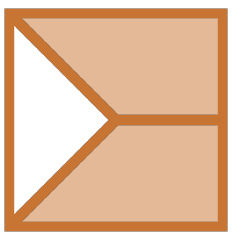
## Approach to solution

We address this by… [solution]



## Value creation

This way we achieve ... [actor], [value]



## Competition

Unlike… [alternatives]

# Design challenge

- Describe what we solve, for whom and why is it relevant both now and in the future?

**Name:**

**Date:**

**Version:**

## What

*What is the essence of the challenge?*

I want to re-design/create the way to...

## Who

*Who is the primary user group?*

The main target is ...

... and thereafter it also targets...

## Why

*What specific facts underpin the challenge?*

Because right now...

... and in the future...

### Good advice for your first design challenge

- Be sure to define the challenge but not the solution space - e.g. narrow target audience, but not specific solution technology.
- Make sure the design challenge is not overly complex - remember that it is an exercise.
- Choose a design challenge you are passionate about to solve - it will be much easier to get your team to agree to solve it with you.
- Choose a design challenge with a human element - "optimize a website for mobile" is not a good challenge - "redesign the experience of [what the website is about] across devices" is a much better start to a challenge.

# Interview guide

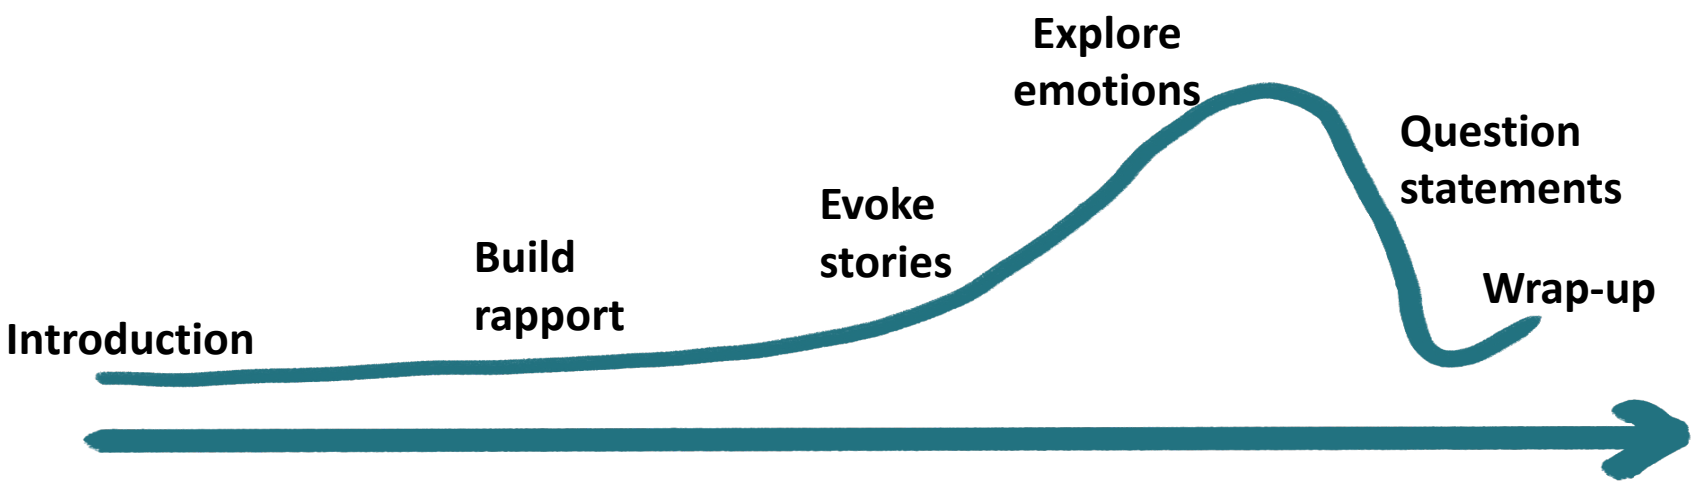
Name:

Date:

Version:

## Structure and principles

*Every interview is different, but you should try to make it feel like a natural conversation and not like an interrogation. This model helps.*



## Principles of interviews

*To ensure a good interview, you should follow these principles for how you as an interviewer should behave during user interviews.*

### Allow the user to talk:

- Encourage stories: Whether or not the stories people tell are true, they reveal how the user perceives the world. Stories reveal what people find normal, acceptable and believe to be true. A good interview should let the user elaborate on the answers, in the same way as in a normal conversation.
- Keep an eye out for inconsistencies: Sometimes what people say and what they do are different. These discrepancies often obscure interesting insights. You should inquire into these discrepancies during a conversation.
- Follow up with the "why" question: Even when you think you know the answer, ask people why they say or do things. The answers will often surprise you.
- Listen to verbal and non-verbal cues: Pay attention to emotions and body language as a way to use the interview to build empathy with the user.

### As an interviewer, you listen:

- Don't suggest answers: Even if someone pauses before they respond, don't help by suggesting an answer. This can inadvertently cause a person to say things that match your expectations.
- Ask questions neutrally: "What do you think of this idea?" is a better question than "Don't you think this idea is good?" because the first question doesn't imply that there's a real answer.
- Don't be afraid of silence: Interviewers often feel the need to ask another question when there is a break. Often, if you allow there to be silence, a person will reflect on what they have just said and say something deeper.

**Designed by:** Ampersand Associates
Amper.dk

## Interview themes

*Write the core themes that you want the interview to be about.*

E.g. Airport security check-up, airport experiences...

## Interview questions

*Write the questions you intend to ask the interviewee*

### Introduction

For example, "My name is Poul and am reimagining our airport security area.... ”

### Kick-off

For example, "When was the last time you were on a flight?...”

### Build trust

For example, "Where do you like to go?...”

### Deepen

For example, "Can you describe the most memorable security experience you've had?... Where was the memorable? …”

### Reflect

For example, "If you were to design the perfect airport experience, how would it be?...”

### Round

For example, "Thank you for your help, it has been a great help to see the airport through your eyes”

# Brainstorm – The Seven Rules

**Name:**

**Date:**

**Version:**

## #1 Snooze criticism

You never know where a good idea will come from. Make sure everyone has a feeling that they are free to come up with their ideas and that they will allow others to build on them.

## #2 Go for the wild ideas

Wild ideas can often give rise to creative inspiration. By thinking of ideas that are crazy or far-fetched, you can more easily relate to what you really want without assuming a lot of technical limitations.

## #3 Build on other people's ideas

Staying positive and building on other people's ideas requires a lot of practice. In the conversation, you should constantly try to use "and" instead of "but", to force yourself to improve instead of criticizing.

## #4 Stay focused on the topic

Try to keep the discussion focused, otherwise you will quickly go into a tangent that is not relevant to the core of your issue or design question.

## #5 Have one conversation at a time

Your team is much more inclined to build on an idea and create a creative breakthrough if you are all fully paying attention to the one who is sharing a new idea.

## #6 Be visual

In brainstorms, you write down post-its and put them on a wall or table. In the process, nothing explains an idea faster than drawing it. And, it doesn't matter that you're far from being a Rembrandt!

## #7 Go for quantity

Go for as many new ideas as possible. In a good brainstorm, up to 100 ideas are often generated in 60 minutes.

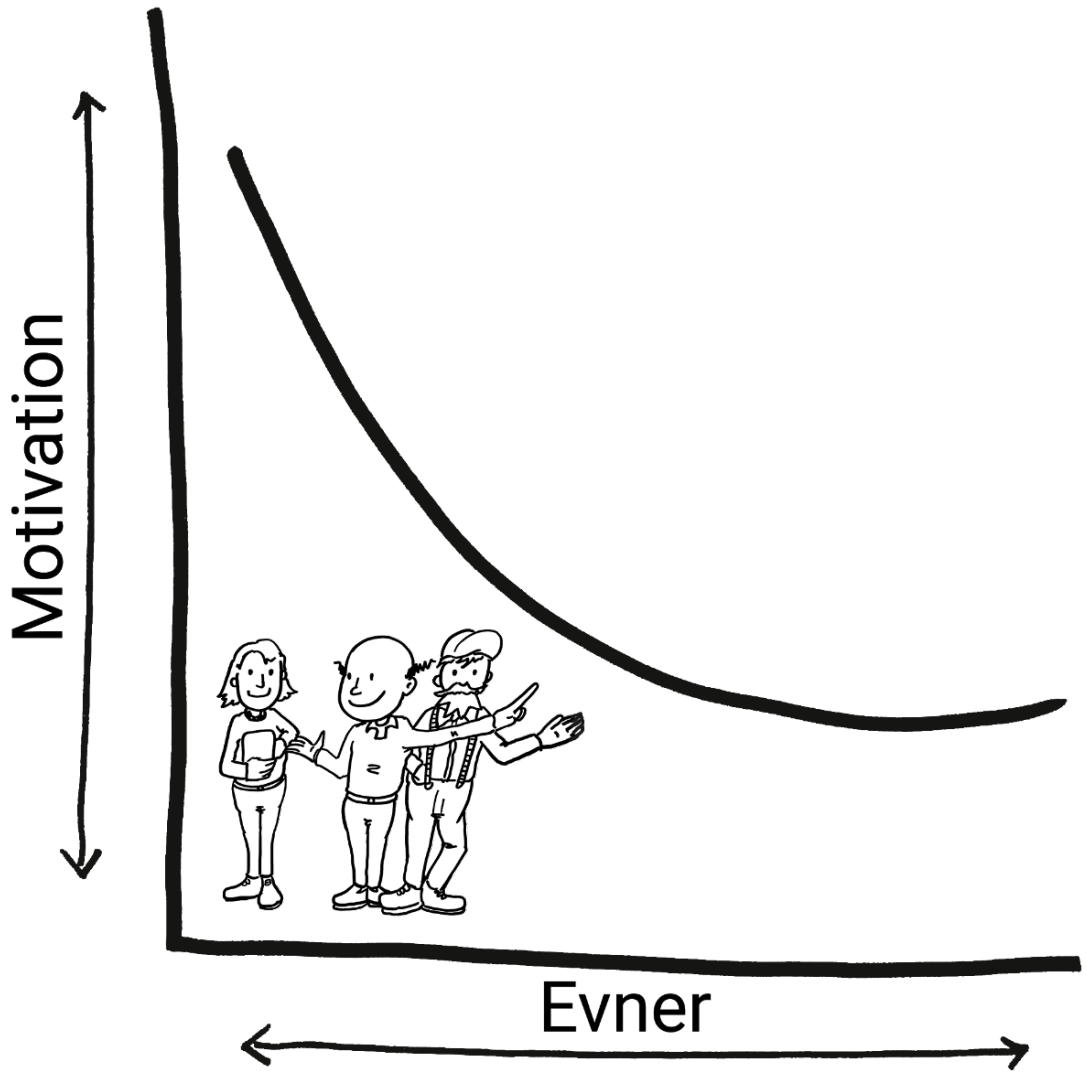
# Behaviour change

Name:
Date:
Version:

## Behavioural model

It's about getting people to move over the line. Achieving a successful change in behaviour requires building motivation and ability, as well as a trigger that can spark the behaviour.



## Triggere for forandring

There are three basic drivers for changing human behaviour, depending on where they are initially placed on the figure above. For example, a highly capable but unmotivated employee is a different challenge than a motivated employee who is incapable of the desired behaviour.

**Trigger**
Helps when people are capable of a change, but not motivated. Examples of triggers are advertising, motivational speeches, social recognition and reward.

**Facilitation**
Helps motivated people who are not capable of change. Facilitation makes behaviour easier or makes it appear easier. Examples are guides for setting up a phone, breaking down a task in smaller parts, and training.

**Signal**
Helps people who are motivated and capable of change but don't really get it done anyway. Signals make sure that you remember to perform a new behaviour. Examples are posters with reminders, an alarm in outlook, and process manuals.

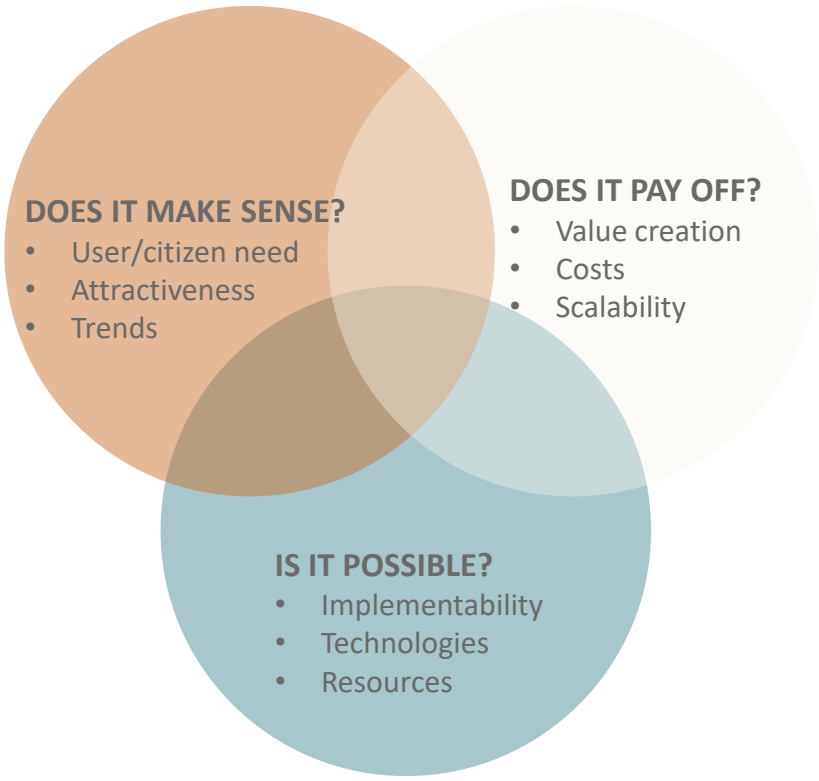
# Team roles in Digital Design

**Name:**

**Date:**

**Version:**



## Using the model

The model is typically used as a quick way to assess the strengths and weaknesses of a team. In the ideal digital design team, all three roles are fully filled.
In practice, you often have to improvise a little, by someone taking on a role for a period of time, or finding one of the missing roles in your network.
The three roles ensure, in collaboration, to balance three key considerations in the project:

## The hipster

The hipster is your expert on user needs. They know what is cool and what will make your product or service unique. Often they also bring insight into brand identity and front-end design to the project. A good Hipster knows that your customers don't just buy a feature - they buy a brand, a feeling and an experience. So build your solution according to the insights the hipster makes sure that you get dug out about the users.

## The hacker

The hacker is your technology specialist. While you may not build an app or piece of software yourself, it's essential to have an attacker on your team who understands how technology can create opportunities for you. There are a lot of free, and close to free, platforms, apps and services around the world that can get you from idea to prototype without requiring too much on the learning front. A good hacker can assess what the best technical solutions are and work well with deeper technology specialists. That way, the Hacker leads the team quickly and cheaply through the best solutions.

## The Hustler

The hustler is your business and organization specialist. They find a way out to users and cultivate the connections that ensure the project gets momentum and has a chance to be scaled in the end. A good Hustler always has an eye on value creation and the network. This is the person who keeps your team on track with the hard questions, like: What is the problem we are trying to solve? Will anyone buy this? How on earth are we going to pay for development?

The end of use of the service or experience.

Design questions:

### Extension

The way the user is withdrawn to the experience or service after completion of use.

Design questions:

## Concept descriptions

Give each concept a name, connect them to their ideas and describe the concept:
**The idea of** a concept describes the value it creates for selected actors (why).
**Idea** in a concept describes how it is intended to be carried out in practice (how).

| CONCEPT NAME: | |

# Test plan

**Name:**

**Date:**

**Version:**

## Concept description

1

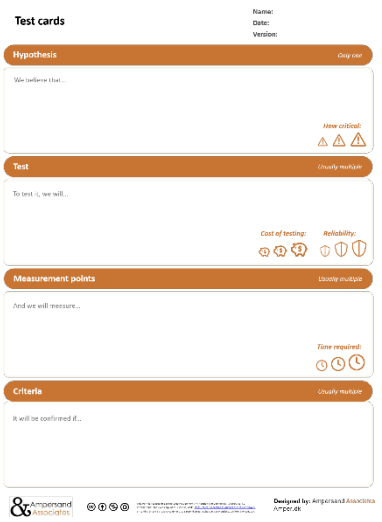
### Hypotheses

Make a list of your hypotheses. Prioritize the critical hypotheses, i.e. those that can kill your concept.

2

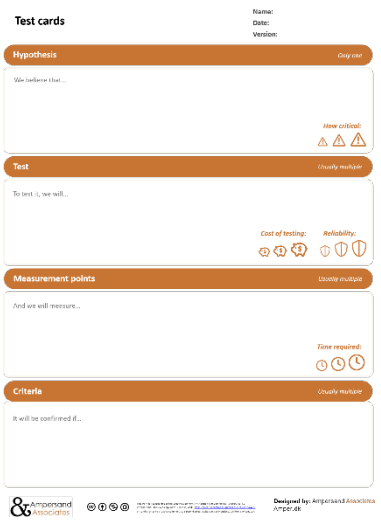
### Test: Waiting list

Tests and experiments you plan to perform to respond to the hypothesis.



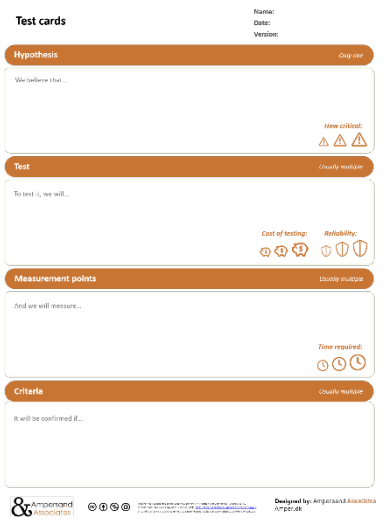
### Test: Preparing

Testing and experimentation You are planning, building and preparing.



### Test: Settlement

Tests and experiments you are running and you are collecting data on.



3

### Prosperity

Completed test, provided with a conclusion sticker for quick overview.
After each completed test, the concept is updated and matures on an ongoing basis
